

Concentricity Gages are used to assist in assuring that certain diameters are concentric or a face is square to the spline pitch diameter. Precision Gage Company supplies concentricity gages to the same tolerance of profiling, spacing, and runout as those applied to our composite gages.

The Concentricity Gage is a segmented design of three splined rings, with two outer rings fixed and the central ring rotating to lock onto the component. To obtain a quantitative value, a dial gage is set onto the concentricity band of the ring, and the component rotated.

+ Specifications

- Plug Type (for use between centers)
- Ring Type (for use between centers)
- Bench Mounted plug and ring type with fixed or positional indicators
